

...and the fact that the *in vitro* and *in vivo* results are in good agreement.

[illegible]

Detailed description of Figure 1: The graph plots the percentage of total catch against the number of hauls for 15 different fish species. The species are listed on the x-axis: *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*, *Chelodactylus*. The y-axis represents the percentage of total catch, with a scale from 0 to 100. A legend at the top right provides a key for the percentage values: 1.0 = 100%, 0.5 = 50%, 0.2 = 20%, 0.1 = 10%, 0.05 = 5%, 0.02 = 2%, 0.01 = 1%, 0.005 = 0.5%, 0.002 = 0.2%, 0.001 = 0.1%. The data points are connected by lines, showing the cumulative percentage of catch over time.
